Seed capital for regulated industries

hmm Ventures Fund I, *at a glance*

Eat, heal, move, power, supply: the five *Necessities* society cannot do without. COVID revealed which industries had to keep running when everything else stopped. Now AI is rebuilding them.

FUND CONSTRUCTION

Target	**$50M** · $35M min · $80M cap
Term	10yr + 2 x 1yr · 4yr investment
Cheques	**25** first-cheque · $1.2M avg
Ownership	15% target at seed
Reserve	35% selective, not auto pro-rata
Geography	AUS 35 · JPN 30 · NZL 20 · SIN 15
Mgmt fee	2.0% yrs 1-5 · 1.5% yrs 6-10
Carry	20% over 8% pref · European waterfall

THE THESIS

Frame	**5 Necessities** across **4 markets**
Screen	Regulatory barrier · two-tier binary
Compression	19,416 → 6,505 → 2,625 → 25
Edge	Entry parity, exit at **premium**
Evidence	T1 Series C round-size **1.53x** · exit rate **2.22x** vs unregulated

RETURNS · LP-NET DPI, PAID-IN (MODELLED)

3.76x TARGET · P75

2.95x BASE · P50 · MEDIAN

Net IRR	17.58% target · 14.25% base

GP

Wahid Tashkandi

Founding GP · Solo-GP

Operator experience	Paddle, Skalata, GoodFit

Five Necessities society cannot do *without*

AI is moving into the physical systems these industries run on, and the software around them: crops that yield more, disease caught earlier, machines that move themselves, grids that balance in real time, materials traced from mine to cell. The company that builds the proof a regulator will accept first compounds a barrier the next entrant cannot replicate without re-clearing every credential.

Food Security Systems

EAT

A contaminated batch reaches shelves. People get sick from food that should have been traced before it left the warehouse.

Higher-yielding, climate-resilient crops, livestock health, food-safety assurance, and farm-to-shelf traceability.

FSANZ · NZ Food Act · SFA

Biomedical Systems

HEAL

A scan is misread. An AI tool is deployed in a clinic without evidence it works, and a patient pays the price.

Earlier diagnosis, drug development, prosthetics and devices, digital therapeutics, and AI-assisted clinical decisions.

TGA · PMDA · Medsafe · HSA

Autonomous Systems

MOVE

A machine moves through public space without safety certification. The first serious incident grounds the entire sector for years.

Field and warehouse robotics, autonomous logistics, uncrewed maritime and aerial systems, and satellite operations.

MLIT · LTA CETRAN · CASA

Power Systems

POWER

A heatwave hits. Batteries sit idle because nobody filed the dispatch paperwork. The blackout was avoidable.

Grid orchestration, storage and demand response, EV charging, and distributed energy that turns buildings and batteries into grid participants.

AEMO · METI · ARENA · ERA

Critical Materials & Supply Integrity

SUPPLY

An EV manufacturer loses its tax credit because it cannot prove where the cobalt came from.

Extraction and processing of critical minerals, mine-to-cell provenance, and verified ESG evidence for strategic-material supply.

EU Battery Reg · US IRA · AU CMS

Regulation is the filter, *not the friction*

Regulation runs the first cut. hmm maintains a *live, classified market map* of 19,416 companies across the four target markets, refreshed monthly and cut by a two-tier regulatory screen. A solo-GP fund can diligence a few hundred opportunities a year and invest in 25 over a four-year investment period. The screen does the deterministic cut before any partner time is spent.

TIER 1 · LICENCE-AS-BARRIER

A regulator has created or tightened a licensing regime, and the operational layer needed to comply with it is missing or under-built. The barrier is ***permission to operate***.

Examples. TGA digital-health · MAS payments · MLIT Level 4 autonomous-vehicle approval.

605 TIER 1 REGULATIONS · 83.4% OF 725 MAPPED GLOBALLY

TIER 2 · COMPULSION-AS-BARRIER

A regulator has not created a licence, but has compelled an industry to do something it was not previously required to do, and the compliance layer is missing. The barrier is ***evidence of compliance***.

Examples. Embodied-carbon disclosure · AI risk assessments · critical-minerals provenance.

120 TIER 2 REGULATIONS · 16.6% OF 725 MAPPED GLOBALLY

19,416	→	6,505	→	2,625	→	25
LIVE CLASSIFIED UNIVERSE		**T1 / T2 BARRIER**		**SEED-STAGE FIT**		**FIRST CHEQUES**
Four APAC markets · refreshed monthly		66.5% cut · no triage		86.5% cumulative		Four-year period

Five facts the market is *already pricing*

The Necessities rest on five structural certainties, each observable in hmm's proprietary 19,416-company dataset and each tied to a specific empirical anchor. None depends on a forecast. The five compound through the canonical Monte Carlo to produce the fund's underwritten return distribution.

1

1.53x

PREMIUM · T1 SERIES C ROUND-SIZE

Seed entry at parity. Exit at premium. The gap widens with stage.

T1 round-size runs **1.12x at seed**, widening to **1.19x at Series A** and **1.53x at Series C**.

2

2.22x

SIEVE · T1 EXIT RATE VS UNREGULATED

Regulation is the sieve for defensible returns at every stage.

T1 **13.41%** vs unregulated **6.03%**, 10–15yr window. **33.5%** of the 19,416 universe sits behind a T1/T2 barrier.

3

63%

ACCELERATION · SERIES C FUNDING TO REGULATED

Regulation absorbs capital at an accelerating rate.

$5.85B T1 + **$0.72B T2** of $10.40B Series C total. Premium widens **1.19x → 1.53x** from A to C.

4

9

ACQUIRERS · NAMED REGULATED-COMPANY ACQUISITIONS

A global strategic-acquirer buyer set exists and is active.

9 acquisitions 2020 to 2026 (8 Western-strategic, 1 intra-APAC). Mandate-aligned: Hims, Teladoc, Autodesk, Banyan, Iberdrola, Accenture, JDM, Paine Schwartz.

5

34

FRONTIER · IN-FLIGHT REGULATIONS 2024-2030

Developed APAC sets frontier regulation in the Necessity categories.

34 regulations across Five Necessities (AUS 11, JPN 11, SIN 10, NZL 2), concentrated **2026–2028** inside the investment period.

Dataset metrics observed in hmm's four-market classified universe. Associative, not causal; classification methodology, survivorship handling, and full tables in the Investment Memorandum.

Why *these four* markets

The fund's four markets are the only four developed APAC markets where the regulation map produces a reliable result: public-source regulatory calendars, traceable parliamentary records, and an exit lane to NA/EMEA strategics that is documented and active. All four are common-law or transparent civil-law systems with public regulator publications and enforceable IP regimes.

Australia

9,389 companies

35%

56 regs · 41 T1 · 15 T2

R&D Tax Incentive extends seed runway 10 to 14 months on average. Superannuation-backed Series A ecosystem. AUS frameworks carry into NZL via Trans-Tasman mutual recognition (FSANZ, Medsafe-TGA). Largest deal-flow universe of the four markets.

9 cheques · Power · Biomedical · Critical Materials · Autonomous

Japan

2,995 companies

30%

49 regs · 36 T1 · 13 T2

CVC-dominant early-stage market. TSE governance reforms creating M&A appetite among mid-caps. PMDA and MLIT approval timelines are the barrier, not the cost. Modelled at 7 to 10 year hold. Highest exit multiples in the portfolio.

8 cheques · Autonomous · Biomedical · AI cross-cutting

New Zealand

2,130 companies

20%

28 regs · 25 T1 · 3 T2

Fastest OECD pathway to Class II medical-device commercial revenue (Medsafe WAND). Callaghan Innovation grant pipeline pre-funds regulatory engagement. Small market means regulator relationships compound quickly.

5 cheques · Food Security · Biomedical · Power

Singapore

4,902 companies

15%

41 regs · 35 T1 · 6 T2

Cross-border hub for ASEAN market access. MAS Regulatory Sandbox with published graduation track record. Most tractable Series A and B follow-on market. RCEP/CPTPP country-of-origin enforcement creates logistics compliance demand.

3 cheques · Autonomous · Biomedical · Food Security

The engine that produces *the 25*

The same map that runs the deterministic cut doubles as the proprietary sourcing input. Companies enter the hmm pipeline through regulator filings, licence applications, and compliance hiring signals, often before they have raised, appeared on Crunchbase, or built a deck.

REFRESH	ENTRY POINT	BUILT AND VALIDATED
Monthly	**Pre-raise**	**4 yrs**
Live against the current four-market universe	Before Crunchbase, before the deck	Classifier live at GoodFit.io

THREE-LAYER SOURCING INFRASTRUCTURE

LAYER 1 · DOMAIN-INDEX (pre-public signal)

Newly registered domains and regulatory filings across all four markets: ASIC, IP Australia, ACRA, MAS, NTA, METI, NZBN, Callaghan, TGA, PMDA, HSA, Medsafe, AEMO, ERA, and sector-specific equivalents. Two-stage pipeline: tech-company validator, then T1/T2 classifier. Built and validated over four years at GoodFit.io. Live against the current universe today.

LAYER 2 · LINKEDIN-INDEX (formation signal)

The same T1/T2 classifier pipeline runs against new company profiles as they appear on LinkedIn. Catches companies that have begun building a public presence but pre-date external funding.

LAYER 3 · RESEARCH SPIN-OUTS (pre-network signal)

Direct engagement with technology transfer offices and research commercialisation programmes. Built into Skalata's institutional sourcing model under the GP's repositioning mandate. Highest-signal introductions for regulated deep-tech.

> *hmm plans to reach a founder pre-raise, before they have run a fundraising process.*

The GP turns category edge into *returns*

That edge lives in the category itself. Whether it shows up in fund returns depends on the GP's sourcing coverage, selection discipline, and ownership mechanics, none of which generalist developed-APAC seed funds run as core practice.

paddle

Cross-border operating

DEC 2017 TO MAY 2022 · SERIES B TO $1.4B SERIES D

Inside twelve months he had built China revenue from a single Chinese-speaking team member, no local entity, and no existing playbook into the third-largest country contribution to total company revenue, and the result persisted long after he had left. The cross-border GTM playbook the fund now transfers at seed was first executed at Paddle: pricing architecture, the first commercial hire, the enterprise sales motion, and cross-border market entry without local presence or local language.

Skalata

Institutional sourcing

2021 TO 2022 · REPOSITIONING MANDATE · EVERY AUSTRALIAN STATE

The founding observation behind hmm became unignorable across the GP's time at Skalata, a generalist fund where the GP was required to rebuild the sourcing engine and increase investment throughput 4x, transforming it from an accelerator to a nationally recognised seed investor. Across that generalist volume the regulated-technology companies stood out: in both the direct portfolio and the anti-portfolio they outperformed the market average, and the ones defensible enough to justify a Series A were systematically under-capitalised at seed.

GoodFit

Live classifier

2022 TO 2026 · VP REVENUE · $13M SERIES A · NOTION CAPITAL · SEPT 2025

The classifier methodology powering Layers 1 and 2 of hmm's sourcing engine was developed and validated across four years inside GoodFit. The architectural pattern most first-time funds spend their first eighteen months building is already running, rebuilt for hmm against a regulated-T1/T2 ICP.

> The same three-in-one quality runs through the operator stack: cross-border APAC operating from Paddle, an institutional sourcing build from Skalata, and the classifier already running from GoodFit. Most generalist seed funds in the target markets carry none of these, and even regulated-sector specialists rarely carry more than one.

Three named cases

Every return number in this deck reads off a single 1,000-iteration Monte Carlo simulation. Target Case is the 75th percentile, the fund's underwritten return target. Base Case is the median. Downside Case is the 10th-percentile floor. All multiples on paid-in basis ($34.65M median called). Before hmm's sourcing and vintage edge, the canonical floor alone returns 2.14x.

FIG 01 LP-NET DPI DISTRIBUTION · MONTE CARLO (N = 1,000)

Target 3.76x at P75 (GP-underwritten). Median 2.95x at P50 (median). 82.8% of paths clear 2.0x.

1,000 draws from the fund-level model. Bin width 0.25x. Base Case canonical.

TARGET (P75)	MEDIAN (P50)	TAIL (P10)	P(≥2X)
3.76x	2.95x	1.70x	82.8%
GP-underwritten	median	Worst-decile floor	Full distribution

Fund I · *commercial terms*

Indicative terms. Full Limited Partnership Agreement available under NDA. All terms subject to finalisation following counsel review and first close.

Fund name	hmm Ventures Fund I, L.P.
Vintage	2026
Fund size	**$50M target** · $35M minimum / $80M hard cap
Management fee	2.0% p.a. years 1 to 5 · 1.5% p.a. years 6 to 10 · on committed capital
Carried interest	20% over 8% preferred return, compounded annually
Waterfall	European (whole-fund)
Investment period	4 years from first close
Fund term	10 years + 2 x one-year GP-led extensions
Cash-flow pacing	Capital called across the 4-year investment period; with 5-to-7-year holds (7-to-10 in Japan), distributions concentrate in years 6 to 10.
Portfolio size	25 first-cheque positions at $50M canonical (20 at $35M minimum close, 27 at $80M hard cap)
Initial cheque	USD $1.2M average, calibrated to 15% target ownership at seed
Follow-on reserve	35% of committed capital, selective (not auto pro-rata), evaluated on merits
Recycling	Enabled, capped at 20% of fund size ($10M at $50M canonical)
Geographic allocation	AUS 35% · JPN 30% · NZL 20% · SIN 15%
Structure	Qualified investor vehicle. Direct investment into portfolio companies. Domicile, governing law, and competent regulator confirmed at first close following counsel review.
Investor eligibility	Professional / wholesale investors only. Minimum subscription USD $500K, waivable at GP discretion for strategic LPs.

INDICATIVE · SUBJECT TO FINALISATION

FULL LPA UNDER NDA

Glossary *of terms*

FIVE NECESSITIES

Eat, heal, move, power, supply: the categories society cannot do without, each rebuilt as AI moves into it.

TIER 1 · T1

Licence-as-barrier. A regulator has created or tightened a licensing regime and the layer needed to comply is missing. The barrier is permission to operate.

TIER 2 · T2

Compulsion-as-barrier. A regulator has compelled an industry to do something new and the compliance layer is missing. The barrier is evidence of compliance.

AI

Not only large language models. hmm backs spatial and physical-world models, computer vision, autonomy and control systems, and domain-specific models, alongside language models where they fit a Necessity.

CLASSIFIED UNIVERSE

The 19,416 technology companies across the four markets held in hmm's live, classified dataset.

IN-THESIS · 6,505

Companies sitting behind a Tier 1 or Tier 2 regulatory barrier.

DPI · PAID-IN

Distributions to paid-in capital. Cash returned per dollar actually called. hmm leads on this basis.

COMMITTED BASIS

The same multiple measured against total committed capital. Lower than paid-in until the fund is fully drawn.

NET IRR

The LP's annualised return after management fees and carried interest.

GROSS MOIC

Multiple on invested capital, before fees and carry.

MONTE CARLO

A 1,000-iteration simulation running the portfolio across thousands of outcome paths to produce a return distribution.

TARGET · BASE · DOWNSIDE

The 75th, 50th, and 10th percentiles of that distribution. Base is the median.

BEAR CASE

A separate parameter-stressed simulation, not a percentile of the base run.

EUROPEAN WATERFALL

Whole-fund carry. The GP earns carry only after LPs receive all capital plus the preferred return.

PREFERRED RETURN

The 8% annual hurdle LPs clear before the GP earns carry.

CARRIED INTEREST

The GP's 20% share of profit above the preferred return.

RESERVE

Capital held back, 35% of commitments, for selective follow-on rather than automatic pro-rata.

RECYCLING

Reinvestment of early proceeds, capped at 20% of fund size.

REGULATORS

Named approval bodies: TGA, PMDA, Medsafe, HSA (health); MAS, ASIC, ACRA (markets); MLIT, LTA (autonomy); AEMO, METI (power); FSANZ (food).

Necessity is the Thesis.
